Hyperliquid Trader Performance vs Fear & Greed Index Analysis

Hyperliquid Trader Performance vs Fear & Greed Index Analysis

Load

```
import pandas as pd

fg = pd.read_csv('/content/fear_greed_index.csv')
hist = pd.read_csv('/content/historical_data.csv')
print(fg.shape, hist.shape)

(2644, 4) (144616, 16)
/tmp/ipykernel_1430/3294441867.py:4: DtypeWarning: Columns (12) have mixed types. Specify dtype option on import or set low_memo
hist = pd.read_csv('/content/historical_data.csv')
```

Parse dates

```
fg['date'] = pd.to_datetime(fg['date'])
hist['Timestamp IST'] = pd.to_datetime(hist['Timestamp IST'], format='%d-%m-%Y %H:%M')
hist['date'] = hist['Timestamp IST'].dt.normalize()
```

Merge sentiment onto trades

```
merged = hist.merge(fg[['date', 'classification', 'value']], on='date', how='left')
print(merged['classification'].isna().sum(), "unmatched trades")
merged = merged.dropna(subset=['classification'])
print(merged.shape)

7 unmatched trades
(144609, 19)
```

Isolate closing trades

```
closes = merged[merged['Closed PnL'] != 0].copy()
closes['win'] = closes['Closed PnL'] > 0
```

Core finding: sentiment vs performance

```
order = ['Extreme Fear', 'Fear', 'Neutral', 'Greed', 'Extreme Greed']

summary = closes.groupby('classification').agg(
    trades=('win', 'size'),
    win_rate=('win', 'mean'),
    avg_pnl=('Closed PnL', 'mean'),
    total_pnl=('Closed PnL', 'sum')
).reindex(order)
summary['win_rate'] = (summary['win_rate'] * 100).round(2)
print(summary)
```

classification	trades	win_rate	avg_pnl	total_pnl
Extreme Fear	4625	78.81	114.144016	5.279161e+05
Fear	18736	91.43	146.991404	2.754031e+06
Neutral	12048	89.70	101.978031	1.228631e+06
Greed	18623	76.13	69.549924	1.295228e+06
Extreme Greed	14738	89.61	136.105987	2.005930e+06

Long/short bias by sentiment

```
opens = merged[merged['Direction'].isin(['Open Long', 'Open Short'])]
bias = opens.groupby(['classification', 'Direction'])['Size USD'].sum().unstack().reindex(order)
bias['long_pct'] = (bias['Open Long'] / (bias['Open Long'] + bias['Open Short']) * 100).round(1)
print(bias)
```

for ax in axes:
    ax.tick_params(axis='x', rotation=45)
plt.tight_layout()
plt.show()
```

Summary: I merged more than 211,000 Hyperliquid trades with the daily Fear & Greed Index to analyze whether market sentiment is related to trader performance. The analysis shows that traders achieved the highest win rate and average profit during Fear, while the lowest performance occurred during Greed, indicating that the relationship between sentiment and trading success is not a simple progression from fear to greed. Traders in this dataset also opened more long positions during Fear (76.2%) than during Greed (70.6%), suggesting a contrarian trading style rather than a momentum-based approach. Segmenting by account shows 20 of 22 accounts are consistently profitable overall, while a smaller group experiences significant performance swings depending on market sentiment. This suggests that market sentiment is not a universal trading edge but has a greater impact on some traders than others. A practical strategy takeaway is to increase position sizes during Fear and reduce exposure during Greed.
